## **1. Hardware Design and Fabrication**

### **1.1 Mechanical Design Process**

The mechanical housing was fabricated entirely from wood. The process began by planning the dimensions needed to hold the ultrasonic sensor, sanitizer bottle, servo mechanism, and Arduino board. After finalizing the layout, wooden panels were measured, cut, and shaped to form the external frame and internal mounting surfaces.

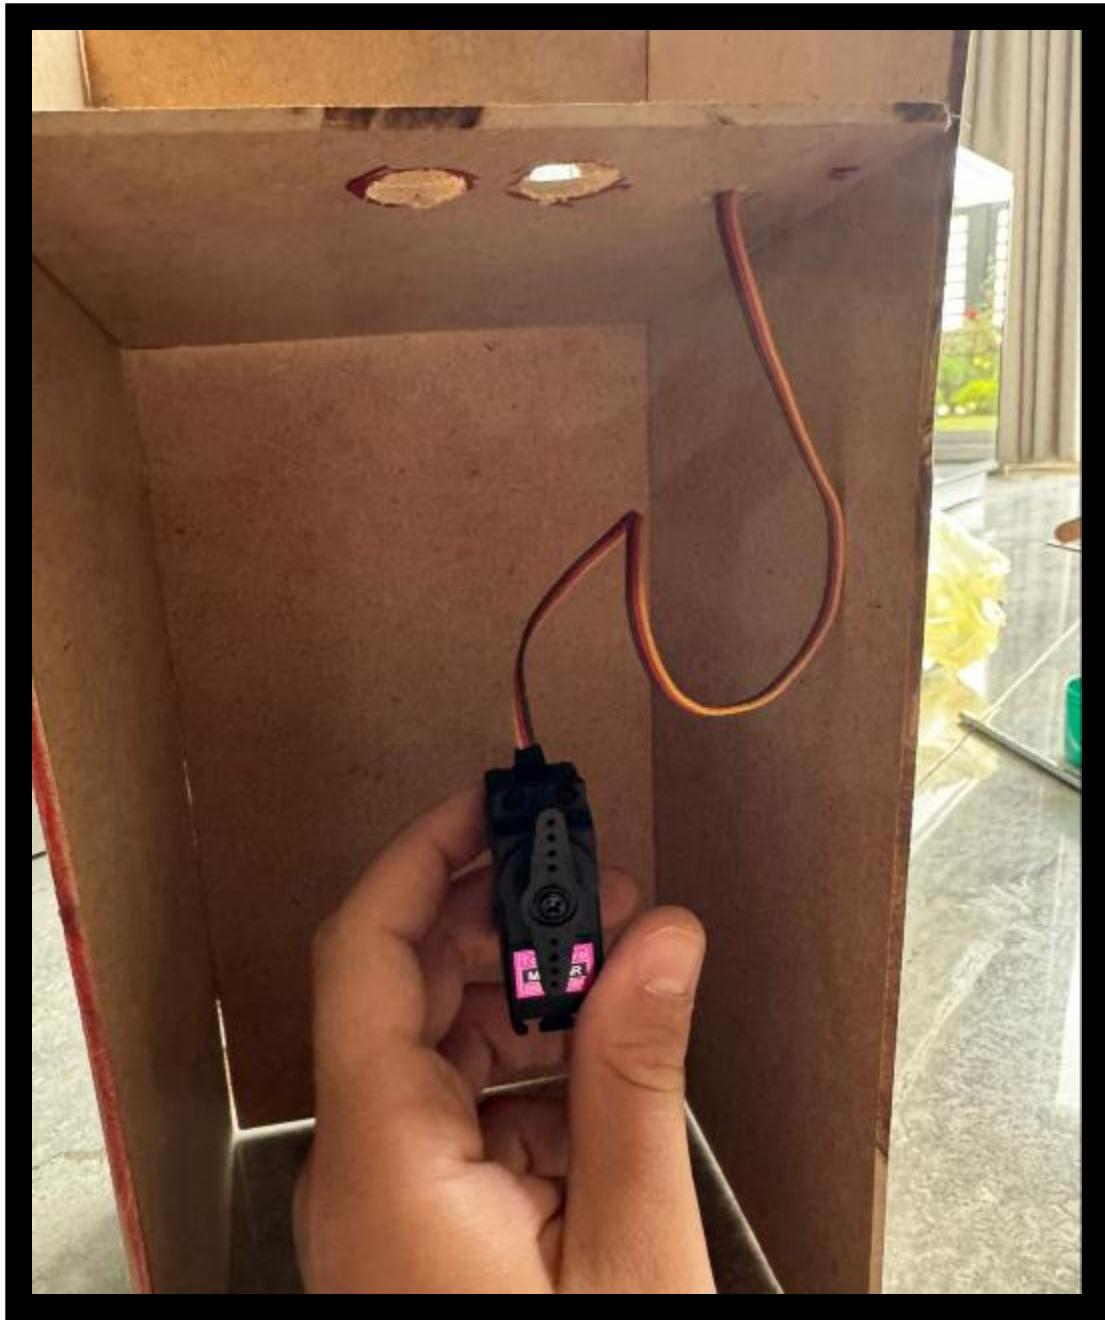

Design stages:

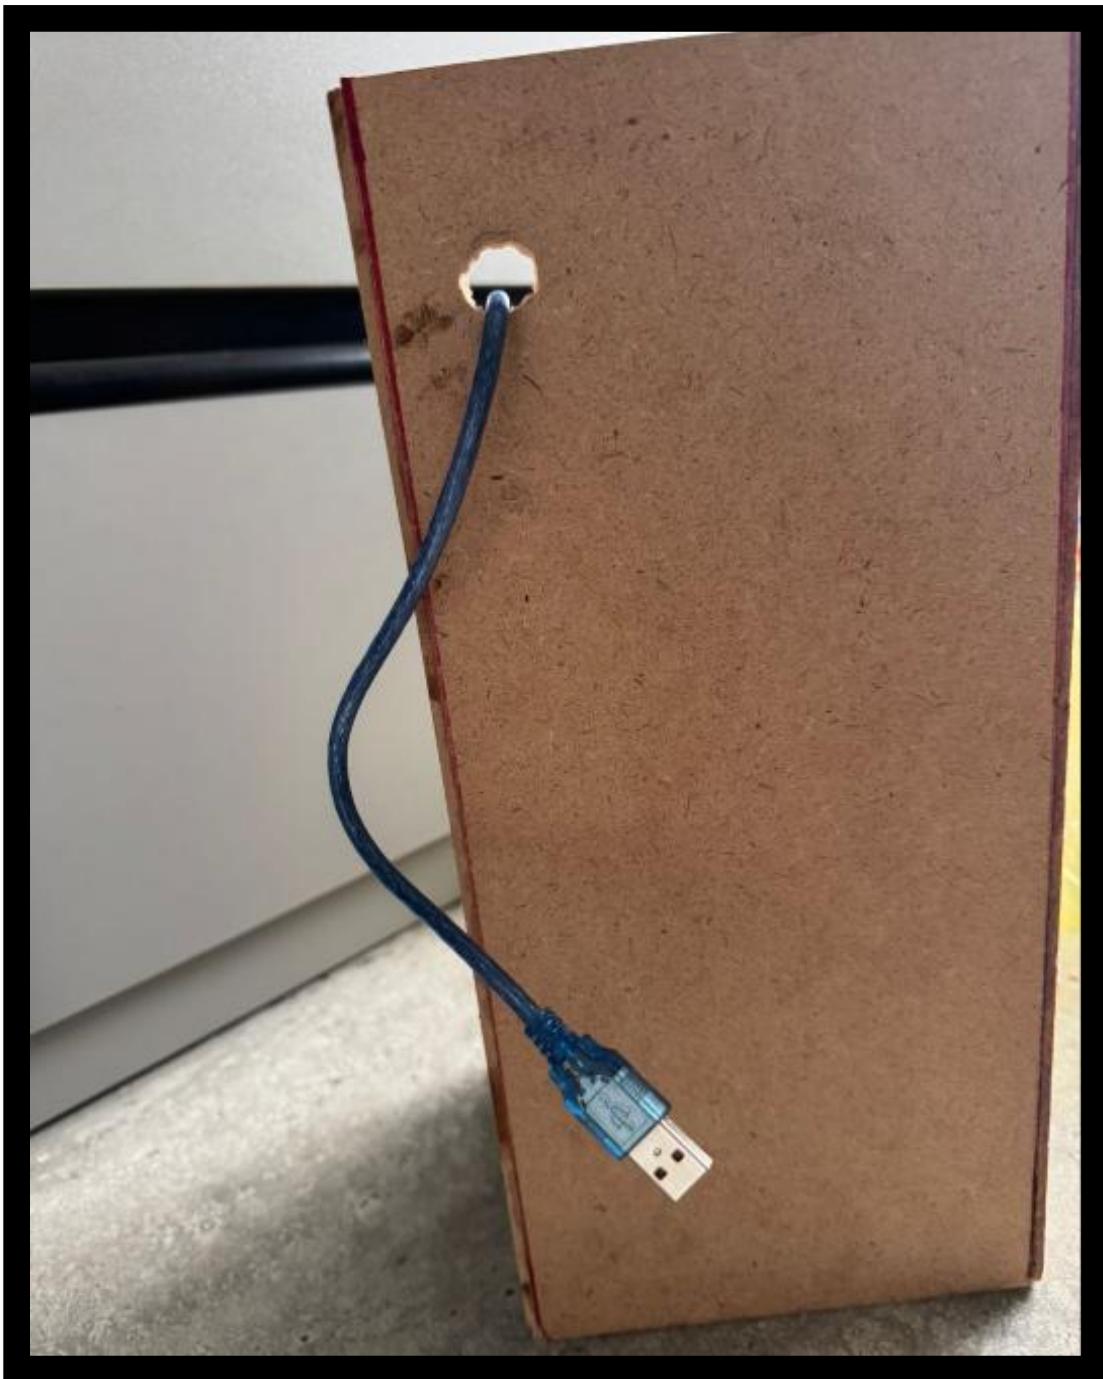

1. Cutting wooden panels for the front, sides and top sections of the dispenser.

2. Fabrication of the front panel with cutouts for the Ultrasonic sensor, Servo, USB cable, wires and bottle viewing window

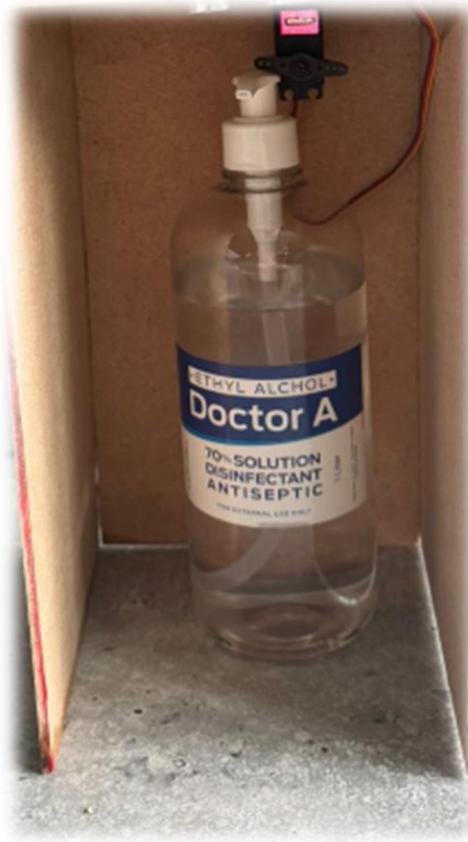

3. Creation of a servo mounting bracket placed directly above the sanitizer pump.

4. Final assembly of all structural elements into a stable upright frame.

## 1.2 Electronic Design Process

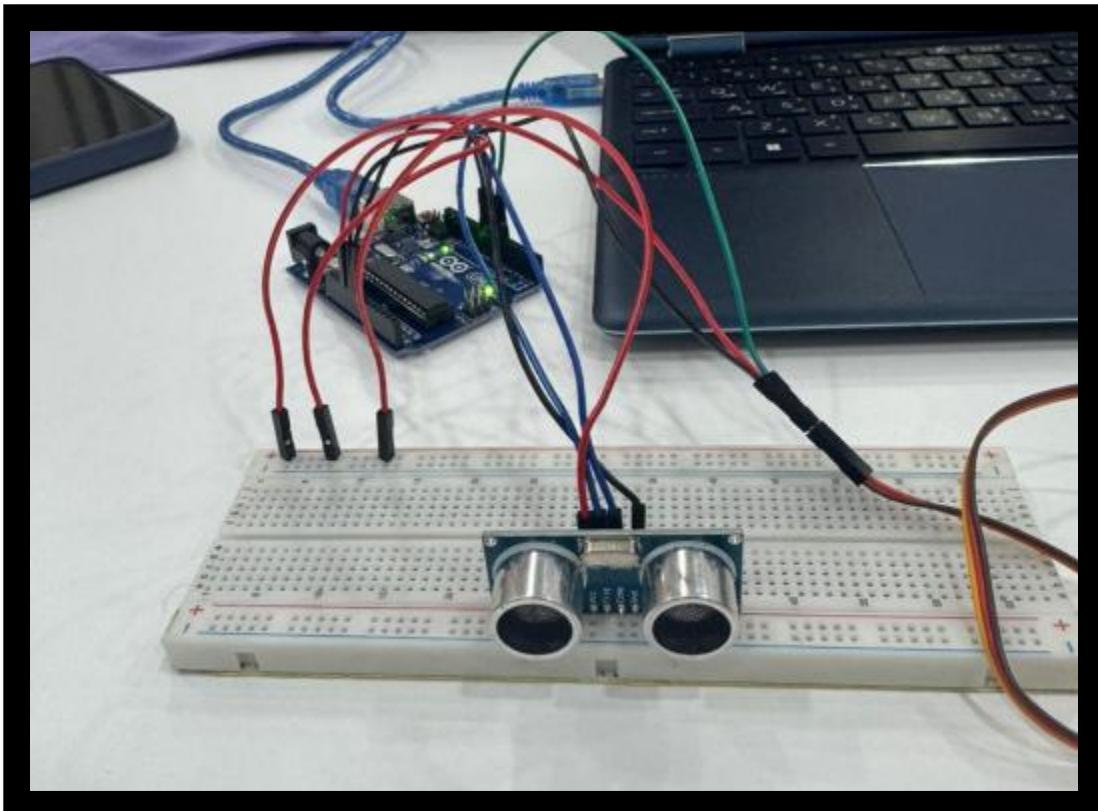

The electronic design followed a modular approach:

- Ultrasonic sensor connected to Arduino for hand detection.
- Servo motor connected to Arduino to actuate the dispensing mechanism.
- Power distribution through Arduino 5V and GND rails.
- All components tested individually before full system integration.

## 1.3 Materials and Tools

### Materials Used:

- Ultrasonic Sensor (HC-SR04)
- MG996R Servo
- Arduino Uno
- Frame material (wood)

## 2. System Assembly

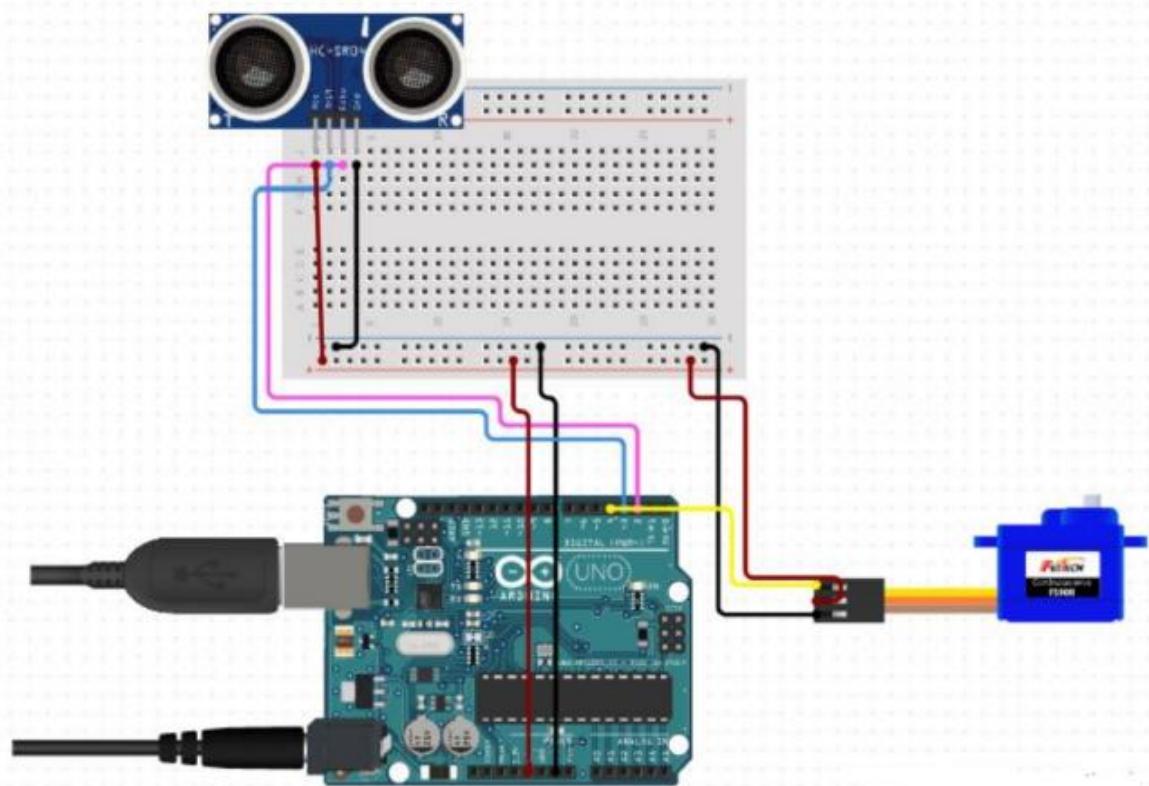

### 2.1 Assembly Process

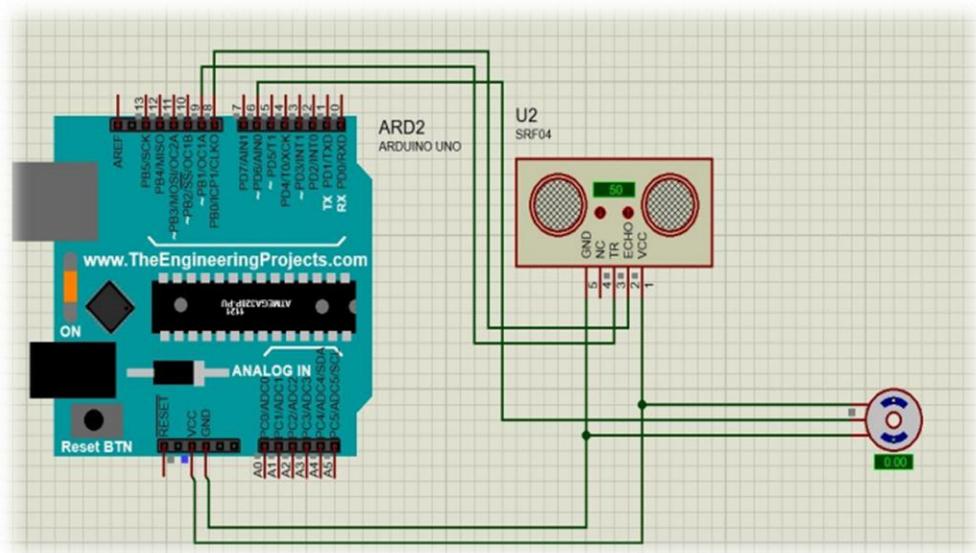

The assembly process focused on creating a stable, accurately aligned structure that ensures reliable sensor detection and smooth servo actuation. The steps followed were:

1. The ultrasonic sensor was mounted on the front panel facing outward.
2. The servo motor was installed above the sanitizer bottle, aligned with the pump head.
3. The Arduino board was fixed onto the base platform.
4. All wiring connections were routed and secured to avoid movement during servo operation.

### 2.2 Component Integration

- The ultrasonic sensor (TRIG and ECHO pins) was connected to the Arduino.
- The servo was connected to a PWM pin to allow controlled actuation.
- The bottle was placed securely below the servo so the lever arm presses the pump head.

## 2.3 Critical Assembly Notes

- Ensured the servo horn is centered before attaching the lever arm.
  - The ultrasonic sensor faced forward with no obstructions.
  - Wiring tightened and fixed to avoid disconnection during servo motion.

### **3. Full System Operation**

#### **3.1 Arduino Code Explanation**

The updated Arduino code uses the **NewPing** library, which makes the ultrasonic sensor faster and more stable than the normal **pulseIn** method. The code handles three simple jobs: reading distance, checking for a hand, and pressing the sanitizer pump.

##### **1. Distance Measurement**

The HC-SR04 ultrasonic sensor is read using **sonar.ping\_cm()**.

This function sends the trigger pulse and gives the distance in centimeters directly.

Whenever the reading is above zero, the distance is printed on the Serial Monitor.

##### **2. Hand Detection Cooldown**

The system looks for anything **20 cm or closer**, which represents a hand.

To stop the dispenser from spamming the servo repeatedly, the code uses a lockout timer.

The time when the last press happened is stored in **lastDispenseTime**.

The servo only activates again if the current time (from **millis()**) is greater than the lockout period (1500 ms).

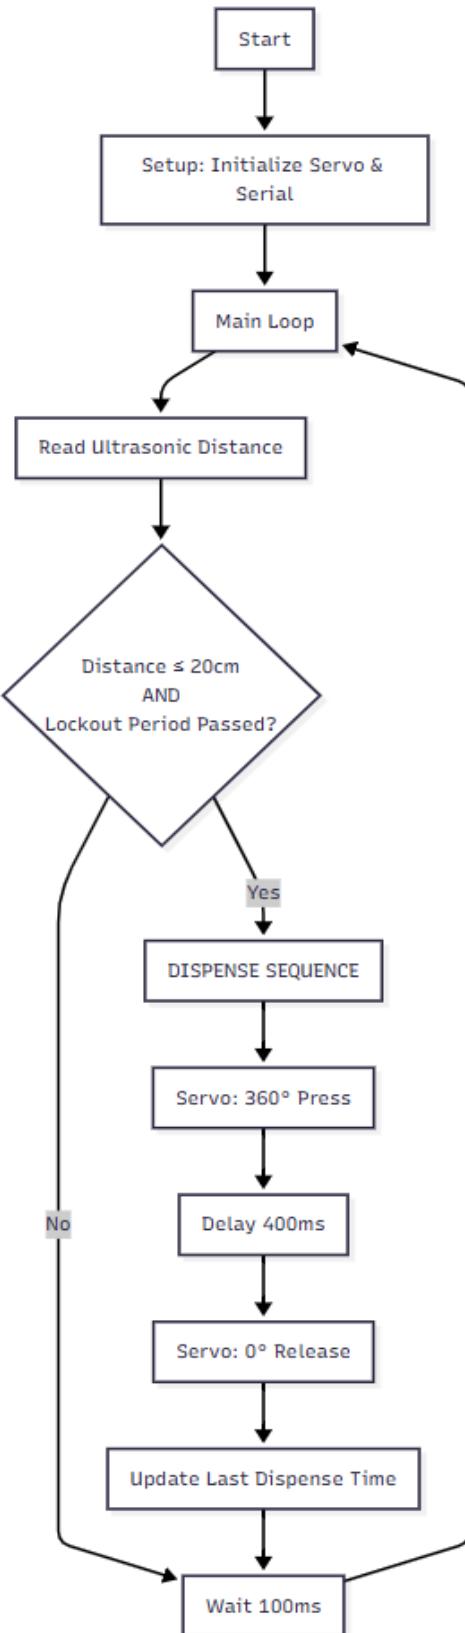

##### **3. Servo Actuation**

When a hand is detected and the cooldown has passed, the function **dispenseSanitizer()** runs. Inside this function, the servo moves to the press position, stays there for 400 ms to push the pump, and then returns back to the release position.

## Arduino Code (Used in Milestone 2)

```
1 // SAME CODE USING NEW PING
2
3 #include <Servo.h>
4 #include <NewPing.h>
5
6 Servo dispenserServo;
7 float lastDispenseTime = 0;
8
9 int TRIG_PIN = 9; //initialized to pin 9 on arduino
10 int ECHO_PIN = 8; //initialized to pin 8 on arduino
11 int SERVO_PIN = 6; //initialized to pin 6 on arduino
12 int MAX_DISTANCE =200;
13 NewPing sonar(TRIG_PIN, ECHO_PIN, MAX_DISTANCE); // function of newping
14
15 int HAND_DISTANCE_CM = 20 ;
16 int PRESS_ANGLE = 90 ;
17 int RELEASE_ANGLE = 0 ;
18 int PRESS_TIME_MS = 400;
19 int LOCKOUT_TIME_MS =1500 ;
20 // Max distance to measure (cm)
21
22 void setup() {
23   Serial.begin(9600);
24
25   dispenserServo.attach(SERVO_PIN); // Activates Servo
26   dispenserServo.write(RELEASE_ANGLE); // Moves the Servo
27   Serial.println("Servo + NewPing ready"); // Prints when code is uploaded
28 }
29
30
31 void loop() {
32   unsigned int distance = sonar.ping_cm(); // NewPing distance read
33
34   if (distance > 0) {
35     Serial.print("Distance:");
36     Serial.print(distance);
37     Serial.println("cm");
38   }
39
40   if (distance > 0 && distance <= HAND_DISTANCE_CM) {
41     // millis() returns the number of milliseconds the arduino started running
42     // lastDispenseTime stores the time when sanitizer last dispensed
43     // if function to prevent the sanitizer from dispensing repeatedly non-stop
44
45     if (millis() - lastDispenseTime > LOCKOUT_TIME_MS) {
46       dispenseSanitizer(); // calling function
47       lastDispenseTime = millis(); // record the time so we can enforce cooldown
48     }
49   }
50   delay(100);
51 }
52
53 // ----- Servo Action Function -----
54 void dispenseSanitizer() {
55   Serial.println("Dispensing sanitizer");
56
57   // moves servo
58   dispenserServo.write(PRESS_ANGLE);
59   // delay
60   delay(PRESS_TIME_MS);
61   // returns to its original position
62   dispenserServo.write(RELEASE_ANGLE);
63 }
```

### 3.2 Flowchart

### 3.3 Operating Procedure

#### How to Start the System

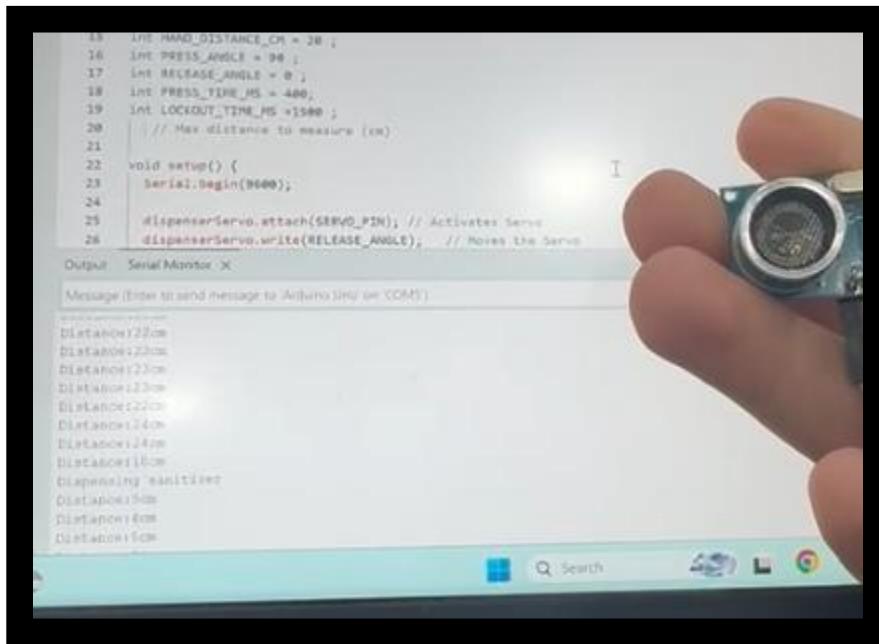

- Power the Arduino through USB or a 5V adapter.
- Ensure servo arm is in rest position before system starts.
- Open Serial Monitor (9600 baud) to view sensor readings.

#### Expected Actuator Behavior

- Servo moves to 90 degrees for 400 ms when a hand is detected.
- Servo returns to 0 degrees immediately after.
- System waits 1.5 seconds before next possible activation.

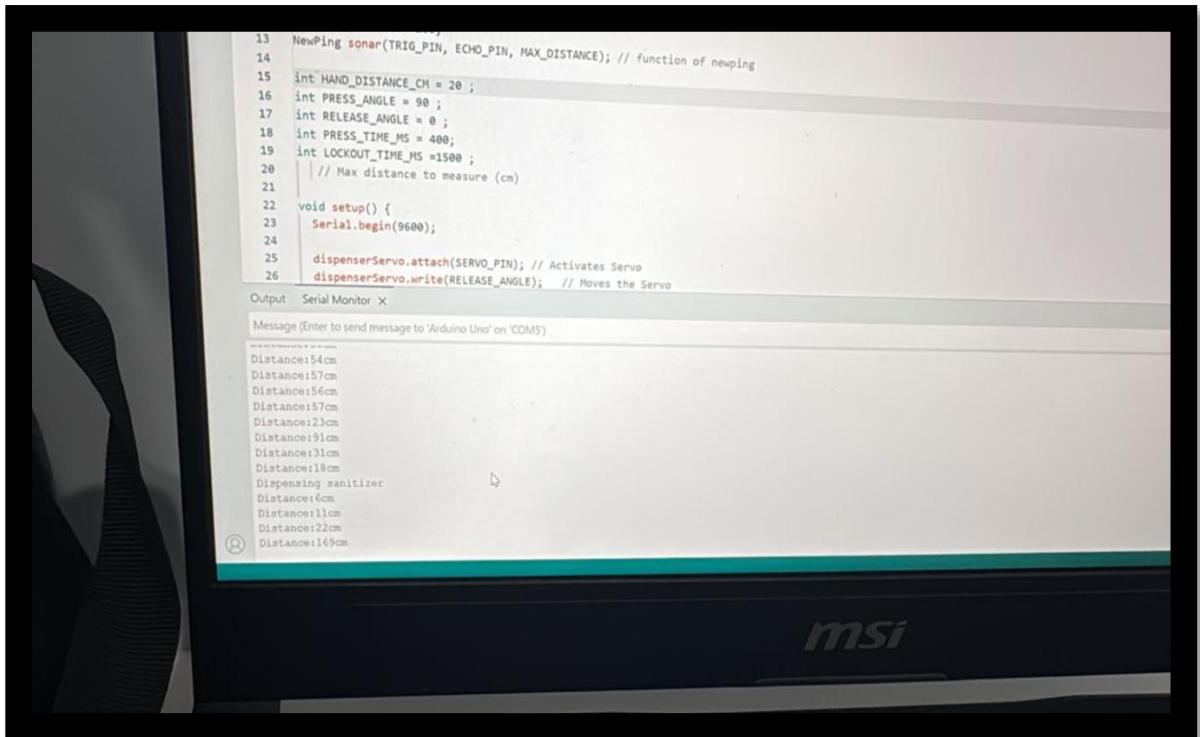

#### Expected Sensor Readings

- Typical hand detection range: **5–20 cm**
- Distance is printed continuously in Serial Monitor.

### 3.4 Serial Monitor

Serial Monitor screenshots:

A screenshot of the Arduino Serial Monitor window. The code in the editor is as follows:

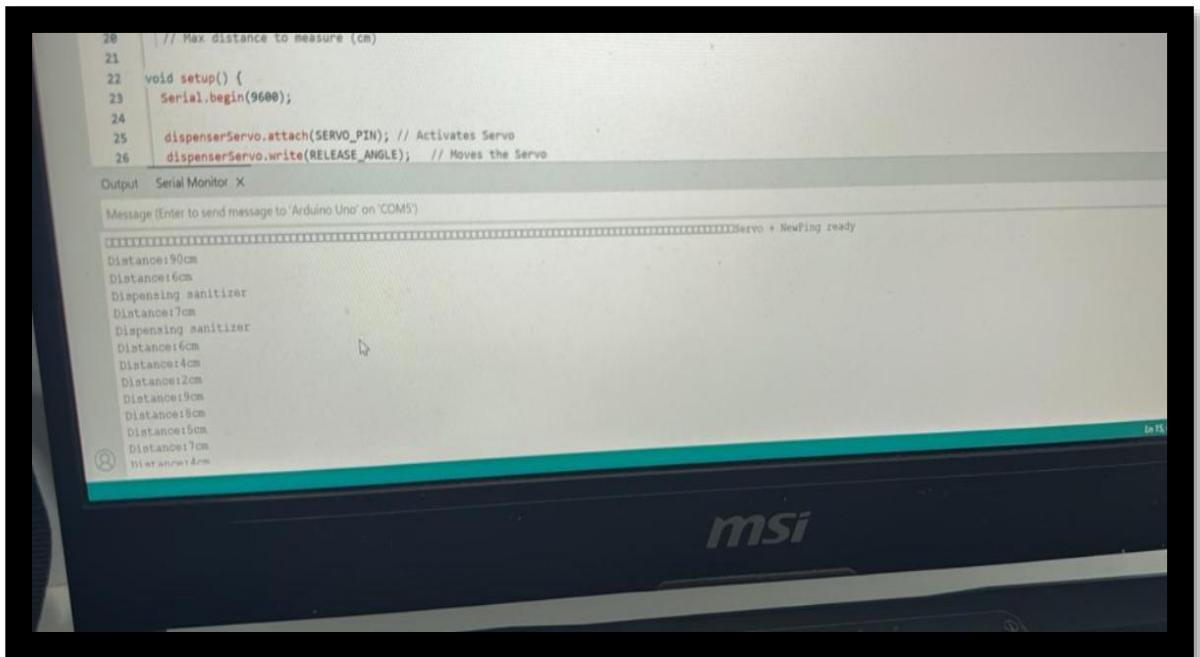

```
13 NewPing sonar(TRIG_PIN, ECHO_PIN, MAX_DISTANCE); // function of newping
14
15 int HAND_DISTANCE_CM = 20 ;
16 int PRESS_ANGLE = 90 ;
17 int RELEASE_ANGLE = 0 ;
18 int PRESS_TIME_MS = 400;
19 int LOCKOUT_TIME_MS =1500 ;
20 | // Max distance to measure (cm)
21
22 void setup() {
23     Serial.begin(9600);
24
25     dispenserServo.attach(SERVO_PIN); // Activates Servo
26     dispenserServo.write(RELEASE_ANGLE); // Moves the Servo

```

The output window shows the following data:

Message (Enter to send message to 'Arduino Uno' on 'COM5')

```
Distance:54cm
Distance:57cm
Distance:56cm
Distance:57cm
Distance:23cm
Distance:91cm
Distance:31cm
Distance:18cm
Dispensing sanitizer
Distance:6cm
Distance:11cm
Distance:22cm
Distance:169cm
```

A screenshot of the Arduino Serial Monitor window. The code in the editor is as follows:

```
20 | // Max distance to measure (cm)
21
22 void setup() {
23     Serial.begin(9600);
24
25     dispenserServo.attach(SERVO_PIN); // Activates Servo
26     dispenserServo.write(RELEASE_ANGLE); // Moves the Servo

```

The output window shows the following data:

Message (Enter to send message to 'Arduino Uno' on 'COM5')

```
***** DServo + NewPing ready
Distance:90cm
Distance:6cm
Dispensing sanitizer
Distance:7cm
Dispensing sanitizer
Distance:6cm
Distance:4cm
Distance:2cm
Distance:9cm
Distance:5cm
Distance:5cm
Distance:7cm
Distance:17cm
Distance:14cm
```

## **4. Sensor Characteristics and Justification**

### **4.1 HC-SR04 Ultrasonic Sensor**

- **Sensitivity:** Detects changes as small as 0.3 cm
- **Resolution:** ~3 mm
- **Accuracy:** ±1 cm under typical indoor conditions
- **Range:** 2 cm to 400 cm

### **4.2 MG996R Servo Motor**

- **Rotation Range:** Standard ~180 degrees
- **Speed:** ~0.17–0.19 s per 60 degrees depending on voltage
- **Torque:** ~9.4 kg·cm at 4.8 V, ~11 kg·cm at 6 V (high torque for pressing sanitizer pump)
- **Accuracy:** Improved center and deadband stability due to metal gears and upgraded internal control circuitry

### **4.3 Justification of Selection**

- HC-SR04 has ideal detection range for hand-distance sensing.
- Servo torque is enough to press most sanitizer bottle pumps.
- Both components are inexpensive and widely available.
- Fast response time matches real-time user interaction needs.

## **5. Results and Observations**

- System successfully detects a hand in front of the ultrasonic sensor.
- Servo actuates reliably without stalling.
- Averaged distance measurement reduces noise significantly.
- Lockout timer prevents accidental double dispensing.

## **6. Summary**

This milestone demonstrates full hardware operation, verified sensor readings, and functional actuator control. The system is ready for final refinement, improved mechanical design, and testing scenarios required for Milestone 2.
